A 62-YEAR-OLD woman is a pioneer in the study of how the human brain works after becoming the first person to undergo tests that can be tried online. She is also the first to have her distinctive voices analysed at the Royal Society in London. She is called the “Voice of Scotland.”

The woman, known only as KH, suffered a brain injury in a car accident 14 years ago and has been diagnosed with developmental phonagnosia, a condition that leaves her unable to remember voices. She even has an inability to remember the sound of her own voice. She avoids people because she has trouble identifying their voices. She said, “I just know who I am talking to.”

In one incident, KH was asked to identify a speaker’s identity by listening to a series of voices played back to back. She later realised, however, that she was unable to identify the speaker’s identity. She said that she did not recognise the voice, and she did not know who she was. She also added that she was not able to understand what was being said. She said, “I just know who I am talking to.”
